

Proposal for **T**

Automated Infrastructure & Proactive Exception Tracking for Transiberia

05/09/2026

PRESENTED BY

Ioanna Renta

Sr AI Consultant

20+ years of experience in logistics and retail sectors transforming operations and leading engineering teams.

Elizabeta Marku

AI Integration Consultant

10+ years of experience automating business operations and connecting systems together.

Executive Context

What We Heard: Baseline & Goals

BASELINE

1,000

Weekly Loads

Transiberia coordinates shipments across Spain and Portugal since 1987. Operating as a **freight forwarder** without an active fleet, 120 employees manage 1,000 weekly loads.

CHALLENGES

5%–6%

Compressed Margins

Currently, margins are compressed to 5%–6% per pallet due to global competition, pushing operations into a **non-profitable state**. Core infrastructure relies on a legacy 2005 SAP framework and fragmented manual channels like WhatsApp and Excel.

12-MONTH TARGETS

+25%

Volume Scale Target

Over the next 12 months, leadership targets a 25% volume scale to **1,250–1,500 weekly loads**, and a **35%–40% revenue expansion**.

The Core Problem Statement

High cost of operational blind spots

TROUBLESHOOTING DRAIN

20–30

HOURS LOST / WEEK

A total lack of centralized visibility forces **reactive exception management**. Transport delays and missing shipments — averaging 3% to 5% of weekly loads — are only discovered after customer complaints or missed deadlines. This operational blind spot drains 20 to 30 hours per week in manual troubleshooting.

ADMIN COST INFLATION

€80

OVERHEAD PER LOAD

Administrative processing costs are inflated to €80 per load.

FATAL PENALTY EXPOSURE

€50,000

MAX RISK PER FATAL LOAD

Critical incidents expose the company to catastrophic financial penalties of up to €50,000 per fatal load.

The Cost of Operating As-Is

Why cost efficiency is the fastest path back to profitability

ANNUAL PROCESSING COST

€4.16M

SPENT PROCESSING TODAY'S VOLUME / YEAR

At €80 in administrative cost per load across 1,000 weekly loads, Transiberia spends €4.16M a year just to process freight — before a single delay or exception is accounted for.

EXCEPTION & PENALTY EXPOSURE

Up to €3.0M

ANNUAL WORST-CASE EXPOSURE

3–5% of weekly loads need manual intervention, and fatal incidents are capped at €50,000 each.

SCALING ON TODAY'S SETUP

Extra €2.3M

NEEDED JUST TO HIT THE GROWTH TARGET

At today's throughput (8.3 loads/employee/week), reaching the +25–50% volume target means hiring 30 to 60 more people — up to €2.3M in additional cost the current setup can't absorb.

Proposed Architecture & Workflow Shift

From reactive firefighting to predictive orchestration

CURRENT STATE

Legacy Day-to-Day Operations

Workflows are dominated by manual Excel entry and phone negotiations. Operations remain purely reactive, firefighting exceptions as they occur.

FUTURE STATE

Automated Ingestion & Alerts

A self-hosted n8n orchestrator with on-premise AI reads SAP order emails, WhatsApp and PDFs directly into one connected view — shifting workflow entirely to predictive orchestration with automated delay alerting.

8h → 2h

CARRIER ASSIGNMENT TIME TARGET

€80 → €40

OPERATIONAL PROCESSING COST (-50%)

Current State — Operational Process Map

How Transiberia runs today, from pricing request to delivery

Future State — Proactive Operating Model

Same process, same team — orchestrated by n8n, with AI built in from step one

● Target: 100% visibility over transit delays

Automated alerts replace manual email/WhatsApp monitoring, and shorten the feedback loop to operators and shippers.

The Connected Ecosystem

n8n, self-hosted — a lean on-premise AI layer, not a SAP re-platform

Ingestion — Four Sources, One Gate

SAP email · WhatsApp API · GPS webhook · PDF attachments — n8n validates every sender first.

n8n orchestrator — self-hosted

AI Processing (4 Nodes)

Doc understanding · Exception classifier · Route deviation · Carrier scorer — all on local Ollama.

AI-NATIVE CORE

Decision router — human-in-the-loop, the EU AI Act compliance gate

Action & Data — Where It Lands

WhatsApp + dispatcher alerts · Sheets updated live · SAP updated · history in PostgreSQL.

GPS INTEGRATION — PICK ONE

Webfleet (TomTom)

Best fit ES/PT — ~€300–500/mo, 20–30 key vehicles.

Teltonika

Cheapest hardware — best long-term cost control.

HERE Routing API

Free tier covers route-baseline calc.

Built By AI Consultants

No SAP consultant, cloud architect or middleware specialist — a two-person AI team builds this in 8–12 weeks.

Best practice for this budget: a lean, self-hosted AI layer around Transiberia's existing SAP rather than a full SAP S/4HANA re-platform — that alone typically runs \$1M–\$8M+ and over 60% of such projects exceed budget.

How the Transiberia AI System Works

One controlled gateway → AI understands → Humans decide → System records

1 Information arrives

Orders & shipment requests

from your ERP system

Carrier updates & messages

via WhatsApp

Live vehicle position

GPS every 5 min

Documents & paperwork

CMR, PoD, rates

2 One intelligent gateway

All information enters through one controlled point — only authorised senders are accepted, and each input is read, understood and routed to the right process.

3 AI understands and scores

Reads every document & message

Extracts route, carrier, status, rate

Spots problems before they happen

On-track / at-risk / critical — confidence scored

Detects route deviations in real time

Compares live position to expected route & schedule

Recommends best carrier

Scores carriers on reliability, lane fit, capacity

4 Human decides — always

Clear situation → system acts automatically, dispatcher notified.

Ambiguous or high risk → dispatcher gets a full AI summary and makes the call.

5 Everything is recorded and the system gets smarter

Live operations view

Every load, status & exception — one screen

Full history

Every decision & outcome feeds back to improve the AI

Your existing ERP

Stays as-is — rates, orders, invoices unchanged

How a Load Moves Through the System

Three scenarios run in parallel — one system, one shared record

New Shipment

Order comes in, carrier needs to be assigned

1

Order arrives

From ERP system — route, cargo, deadline

2

Route is calculated

Expected path, distance & time set automatically

3

AI scores all carriers

Ranked by past performance on this route

4

Dispatcher confirms

Reviews top recommendations, makes the call

5

Carrier is booked

Confirmation sent automatically; record created

Load in Transit

Carrier sends updates, GPS tracks position

Carrier sends update

Via WhatsApp — plain language, any format

AI reads the message

Extracts status, location, issues — no manual entry

Position is checked

Live GPS vs. expected route & schedule

Status is assessed

On track, delayed, or needs attention — scored automatically

Record updated

Ops dashboard reflects reality in real time

Exception Occurs

Something goes wrong — or might go wrong

Problem detected

GPS off route, carrier silent, or AI flags risk

AI assesses severity

Classifies: minor / significant / critical

Dispatcher alerted

Full summary sent — what happened, confidence, options

Decision made

Dispatcher acts — reroute, backup carrier, notify client

Outcome recorded

Added to carrier history; improves future predictions

All three scenarios end the same way — record updated, carrier history improved, system learns.

Zero manual data entry

Messages, documents and GPS feed in automatically; team reads summaries, not raw data.

No surprise exceptions

Patterns are spotted before they become problems; earlier warning means cheaper fixes.

Gets better over time

Every load, rating and route outcome feeds back in, predictions improve automatically.

Strategic Scope — Out of Scope

Deliberate boundaries keep the build lean — AI processing is part of the Core, not an add-on

To ensure targeted impact, this proposal explicitly excludes certain technologies.

EXCLUDED

No Fleet Telematics

Because Transiberia functions strictly as a freight coordinator without an active fleet, we are omitting fleet telematics.

EXCLUDED

n8n Maintenance

We are not responsible for ongoing maintenance, data integrity or future retraining. As the solution is on-premise, your team gains and retains full control as business needs evolve.

EXCLUDED

No Pricing Engine

We are intentionally postponing predictive pricing automation to focus entirely on proactive exception management.

EXCLUDED

No Custom App

We integrate an existing GPS provider rather than building a custom tracking app from scratch.

Implementation Roadmap

~20 weeks end-to-end, five phases — AI is built in from Phase 2, ~~not bolted on later~~

1

WKS 1-4

Discovery & Assessment

Process audit: SAP verified email flow, WhatsApp, exception handling. Technical assessment includes SAP config, GPS choice, VPS infrastructure & sizing. Final architecture design.

2

WKS 5-16

Infrastructure & AI Nodes

Core build: server, SAP email integration, WhatsApp API, GPS webhook, routing API, dashboard. AI nodes (doc extraction, exception classifier, route deviation, carrier scorer) built in parallel from Wk 9.

3

WKS 17-18

Testing & Pilot

End-to-end testing on real loads with a pilot group of carriers and dispatchers; issues fixed before wider rollout.

4

WK 19

Full Rollout & Training

Live for all carriers and loads; ops team trained on the live dashboard and the exception workflow.

5

WK 20

Handover & Maintenance

Technical runbook handed to a dedicated maintenance engineer for day-to-day upkeep. SilverTrust does not run ongoing n8n flow maintenance.

20 weeks total — AI nodes are built in parallel within Phase 2, and a dedicated maintenance engineer (needs to be hired in case it does not exist from the beginning) takes over day-to-day upkeep at handover, not SilverTrust.

Savings & Growth Outlook

Cost control first — the real, all-in opportunity behind the investment ahead

IMMEDIATE SAVINGS

~**€2.08M/yr**

ANNUAL SAVINGS AT TODAY'S VOLUME

Cutting processing cost from €80 to €40 per load saves €2.08M a year at today's volume — before the (very small) build cost is netted out (see Real Net Opportunity, right).

REAL NET OPPORTUNITY — YEAR 1

~**1.93M**

NET OF THE ENTIRE N8N BUILD & RUNNING COSTS

This is what's left after the full n8n build (€40–46K), running costs (€9–13k) and a forward deployed engineer (€88–95k) — total investment €143–154K. Payback in under a month. Full breakdown in the n8n Cost Breakdown.

SEQUENCING

Lean Build → Scale

AI-NATIVE FROM DAY ONE

AI processing is part of the Core build — **it pays for itself in under a month**, freeing budget and headcount to fund the +25–40% growth target from day one.

Investment & Cost Estimate

A lean n8n build — well under your €500K budget, AI included in the Core

PHASE 0 — Discovery & Assessment (Wks 1–4)	Cost
Process audit, technical assessment, architecture design	€6,800
PHASE 1 — Infrastructure & Integrations (Wks 5–12)	
Server, SAP email, WhatsApp, GPS, HERE routing, Sheets	€10,500
PHASE 2 — AI Nodes (Wks 9–16, parallel)	
Doc extraction, exception classifier, deviation, scorer	€11,750
PHASE 3 — Testing, Pilot & Handover (Wks 17–20)	
End-to-end testing, ops training, handover, PM	€11,350
BUILD TOTAL (consulting, before contingency)	€40,400
With 15% contingency	€46,460

TECHNICAL SETUP & RUNNING COSTS — CLIENT-SIDE

One-time setup €3,250–4,500

VPS config, Meta WhatsApp verification, GPS hardware (20–30 units)

Monthly recurring €462–700/mo

VPS hosting, WhatsApp templates, GPS tracking

FDE Engineer €88k–95k/yr

From handover (Wk 20) - ongoing n8n maintenance and future development.

**SilverTrust's boutique tier — €400–600/day (vs €700–1,000 mid-market, €1,400–2,000 Big 4/Tier 1). Full 3-tier comparison in the Annex.*

Total Year 1 investment: €143,000–154,000 (build + running costs + forward deployed engineer) → Year 1 net return: ~€1.93M. That's more than 14x back in year one. See the n8n [Cost Breakdown & Consultancy Build Cost annex](#) for the detailed calculation.

The Strategic Ask & Next Steps

1

BUDGET

Total Year 1 investment (€143-154K, incl. the client-side FDE) comfortably within the €500K allocation — over €345K in headroom to fund the growth target.

2

SIGN-OFF

Sign off Phase 0 — discovery & assessment across SAP, WhatsApp, GPS and architecture design (€6,800, 4 weeks).

3

KICK-OFF

Official Kick-off and assessment workshops with Marc and operational leads.

SilverTrust — by the numbers

1

9 years

helping enterprise teams adopt AI across Europe, since founding in 2017 with an agile team of 30 experts and engineers.

2

140+ engagements

delivered across finance, healthcare, retail, manufacturing, and logistics

3

82%

of pilots move into full production within 12 months

"Nearly a decade of turning AI pilots into systems enterprise teams actually run."
